The most common processing approach in the time or space domain is enhancement of the input signal through a method called filtering. Digital filtering generally consists of some linear transformation of a number of surrounding samples around the current sample of the input or output signal. There are various ways to characterize filters; for example:

In signal processing, a digital filter is a system that performs mathematical operations on a sampled, discrete-time signal to reduce or enhance certain aspects of that signal. This is in contrast to the other major type of electronic filter, the analog filter, which is an electronic circuit operating on continuous-time analog signals.. A digital filter system usually consists of an analog-to ...

Other recursive filter programs: rffr.c - Calculates the frequency response of a recursive filter using the coefficient file created by one of the above programs. rdf.c - Filters data from an input file, using a coefficient file generated by one of the above programs.. FIR Nonrecursive Digital Filters. A general nonrecursive filter is implemented as follows:
